

Network Security/End-User Awareness Training

In this day and age with everything from the Crypto Virus to Phishing attacks and credit card theft, critical data is very vulnerable: to theft & destruction.

Most of these things can be prevented by 2 simple things:

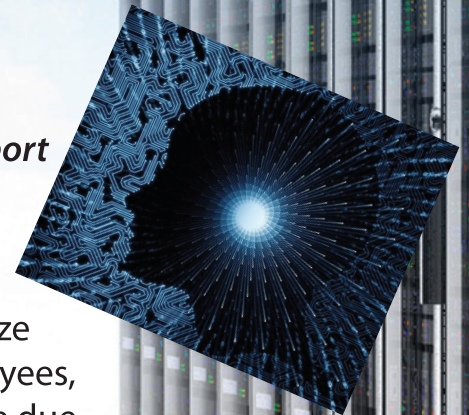

1. End-user awareness training
2. Network\system vulnerability testing and remediation.

We offer both! We can launch a simulated phishing attack on the people in your company and see how well your users respond to phishing attempts. We offer education and training on how to detect these attacks and not fall victim to them. Your data is at risk! **95% of all successful attacks involve human error...**

Cost of Phishing Attacks? More than you think!

The average 10,000 employee company spends \$3.7 million a year dealing with phishing attacks, according to a new report from the Ponemon Institute.

The report, which surveyed 377 IT professionals in companies ranging in size from less than 100 to over 75,000 employees, showed that about half of the costs were due to productivity losses.

Summarized calculus on the cost of phishing

Estimated cost

Part 1. The cost to contain malware	\$ 208,174
Part 2. The cost of malware not contained	\$ 338,098
Part 3. Productivity losses from phishing	\$1,819,923
Part 4. The cost to contain credential compromises	\$ 381,920
Part 5. The cost of credential compromises not contained	\$1,020,705
